What is Python?

Python is a high - level, general - purpose interpreted programming language known for its simple and readable syntax.

Python was created by Gudio Van Rossum and was first released in 1991.

Python is widely used in:

- Web development
- Data analysis
- Artificial Intelligence
- Machine learning
- Automation
- Scientific Computing
- Desktop applications
- Game Development
- Cybersecurity
- Database programming
- Education

Simple Python Code:

```
print("Hello world")
```

Output:

```
Hello world
```

The print() function displays information on the screen.

Why learn Python?

Python is popular because its syntax is relatively easy to understand.

Python requires considerably less boilerplate, then C++ or Java.

Major Advantage

1. Easy to learn.
2. Easy to read.
3. Open source.
4. Cross - platform.
5. Large standard library.
6. Large ecosystem of 3rd - party libraries.

7. **Supports multiple programming paradigms.**
8. **Suitable for beginners as well as professionals.**

Features of Python

1. **Simple**
2. **High level language**
3. **Dynamically typed language:** Python is dynamically tied. We do not normally have to specify a variable's data type when creating it.
